

# Archeological findings Dataset

**Description:** The heatmap highlights locations of early human archaeological findings, dated using radiometric methods.

**Key Insights:**

- Early civilizations appear to have originated around equatorial regions, likely due to the favorable and mild climate that supported early human settlement and development.
- A significant concentration of findings is visible in **Africa**, supporting the theory that humanity's origins trace back to this continent.
- Additional clusters in **Asia** and the **Middle East** suggest that early human migration and cultural development followed climate-friendly and resource-rich corridors.
